Week 5: GANs Kaggle: I’m Something of a Painter Myself

Project Topic: Train GANs to generate 7000 - 10000 Monet-Style images.

1. Import the necessary python libraries

In [1]:
```
import os
import zipfile
import glob
import time
import numpy as np
from PIL import Image
import tensorflow as tf
from tensorflow.keras import layers
import matplotlib.pyplot as plt
```

```

```

Get the paths for JPGs and TIFs files.

In [3]:
```
monet_data_dir = os.path.join(os.getcwd(), "gan-getting-started")
monet_jpg_dir = os.path.join(monet_data_dir, "monet_jpg")
monet_tfrec_dir = os.path.join(monet_data_dir, "monet_tfrec")
photo_jpg_dir = os.path.join(monet_data_dir, "photo_jpg")
photo_tfrec_dir = os.path.join(monet_data_dir, "photo_tfrec")
```

2 Exploratory Data Analysis (EDA)

Prints the total number of Monet images, and the first 5 paths of the Monet images.

In [4]:
```
monet_jpgs = [os.path.join(monet_jpg_dir, jpg) for jpg in os.listdir(monet_j

print(f"Total number of Monet images: {len(monet_jpgs)}")
print(f"First 5 images:\n{monet_jpgs[:5]}")
```

```
Total number of Monet images: 300
First 5 images:
['/workspace/gan-getting-started/monet_jpg/632ddbc784.jpg', '/workspace/gan-
getting-started/monet_jpg/a8fbbe3eb1.jpg', '/workspace/gan-getting-started/m
onet_jpg/fdf1530d95.jpg', '/workspace/gan-getting-started/monet_jpg/7239ba0b
55.jpg', '/workspace/gan-getting-started/monet_jpg/7341d96c1d.jpg']
```

Prints the total number of Photo images, and the first 5 paths of the Photo images.

In [5]:
```
photo_jpgs = [os.path.join(photo_jpg_dir, jpg) for jpg in os.listdir(photo_j

print(f"Total number of Monet images: {len(photo_jpgs)}")
print(f"First 5 images:\n{photo_jpgs[:5]}")
```

```
Total number of Monet images: 7038
First 5 images:
['/workspace/gan-getting-started/photo_jpg/472d5ac100.jpg', '/workspace/gan-

```

Sets Global variables to be used later on.

- IMG_SIZE = 256: Resize all input images to 256×256 pixels.
- BATCH_SIZE = 4: Process four images at a time during training.
- EPOCHS = 100: Run 100 full passes over the dataset.
- LR = 2e-4: Use a learning rate of 0.0002 for both generators and discriminators.
- BETA_1 = 0.5: Set the Adam optimizer's exponential decay rate for the first moment estimates.
- LAMBDA_CYCLE = 10.0: Weight of the cycle-consistency loss term.
- LAMBDA_ID = 0.5 * LAMBDA_CYCLE: Weight of the identity loss (half the cycle weight).
- SAMPLE_INTERVAL = 10: Save example translations every 10 epochs.
- OUTPUT_DIR = "cyclegan_output": Folder for generated images, model checkpoints, etc.; os.makedirs(..., exist_ok=True) creates it if it doesn't already exist.
- AUTOTUNE = tf.data.AUTOTUNE: Let TensorFlow dynamically tune parallel calls and prefetch buffer sizes for your data pipeline.

In [6]:
```
IMG_SIZE       = 256
BATCH_SIZE     = 4
EPOCHS         = 100
LR             = 2e-4
BETA_1         = 0.5
LAMBDA_CYCLE   = 10.0
LAMBDA_ID      = 0.5 * LAMBDA_CYCLE
SAMPLE_INTERVAL = 10
OUTPUT_DIR = "cyclegan_output"
AUTOTUNE = tf.data.AUTOTUNE
os.makedirs(OUTPUT_DIR, exist_ok=True)
```

This function reads a JPEG file from disk, decodes it into a 3-channel image tensor, and resizes it to your model's fixed IMG_SIZE square. Finally, it scales the pixel values from the original [0, 255] range to [–1, 1], which helps stabilize GAN training, and returns the ready-to-use image tensor.

In [7]:
```
def load_image(path):
    img = tf.io.read_file(path)
    img = tf.image.decode_jpeg(img, channels=3)
    img = tf.image.resize(img, [IMG_SIZE, IMG_SIZE])
    img = (img / 127.5) - 1.0
    return img
```

Prints out the shape of the a sample Monet JPG.

In [8]:
```
sample_monet_jpg = load_image(monet_jpgs[0])
print(f"JPG shape: {sample_monet_jpg.shape}")
```

```
JPG shape: (256, 256, 3)
```

```

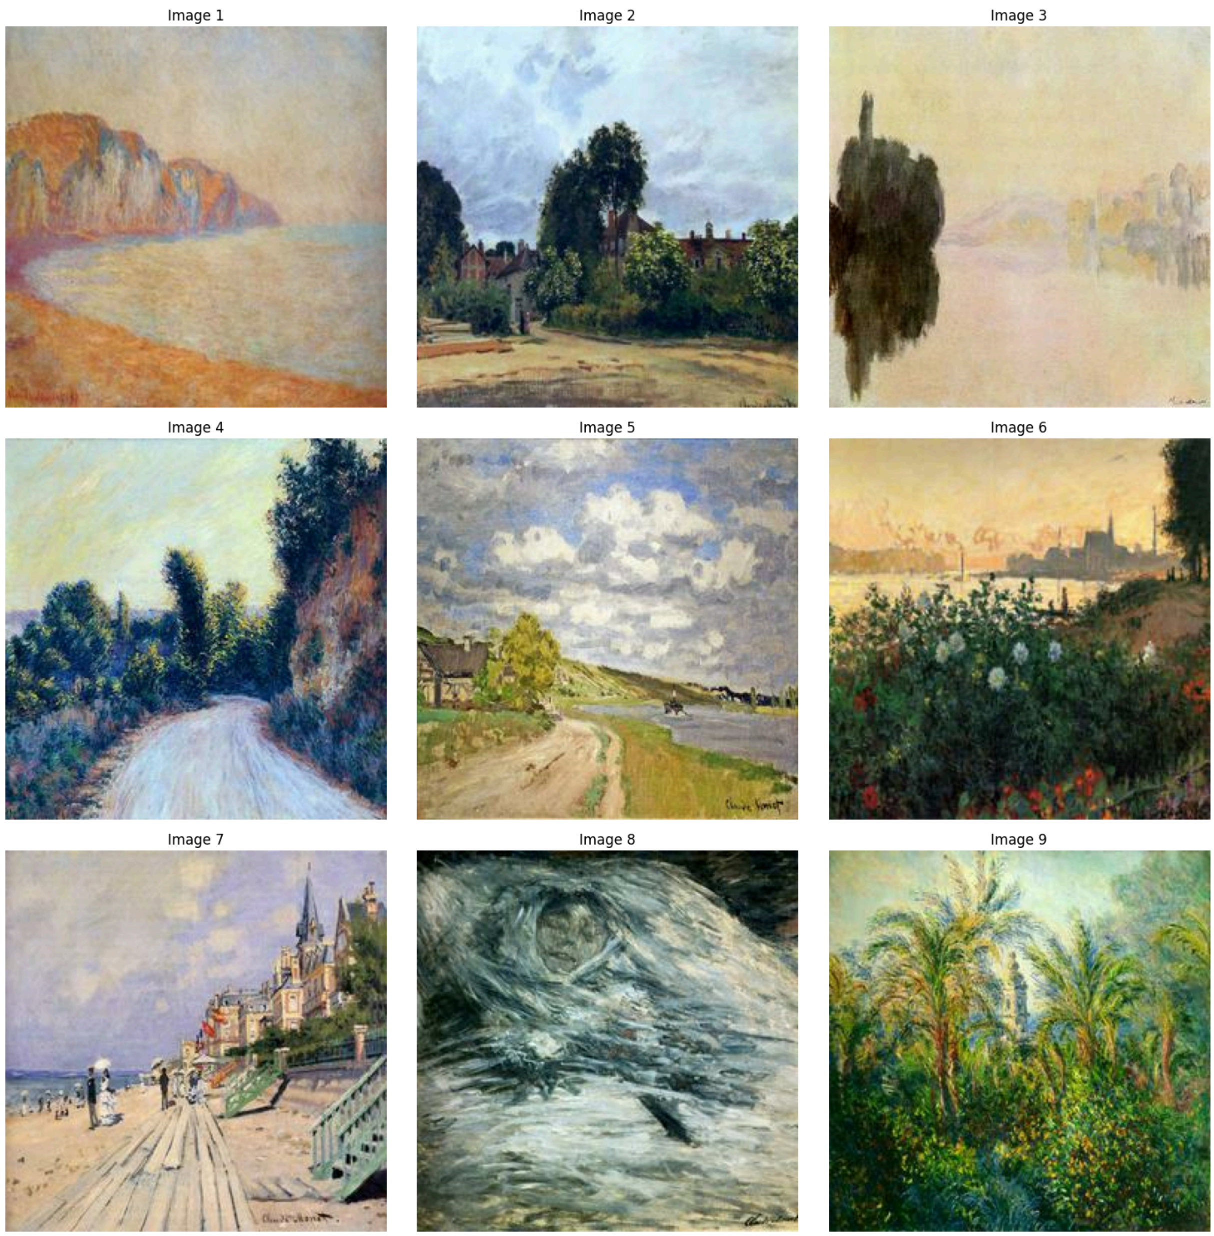
This code creates a 3×3 grid of 15×15-inch subplots at 100 DPI, then flattens the axes array so it can loop through the first nine Monet image paths. For each subplot, it loads and rescales the image tensor from [–1, 1] back to [0, 1] for display, hides the axis ticks, and titles it with its image number. Finally, it applies a tight layout to remove extra padding and renders the figure.

In [9]:
```
fig, axes = plt.subplots(
    nrows=3, ncols=3,
    figsize=(15, 15),    # square canvas
    dpi=100
)

axes = axes.flatten()
for ax, path in zip(axes, monet_jpgs[:9]):
    img = load_image(path)
    ax.imshow(((img + 1.0) / 2.0).numpy())
    ax.axis("off")
    ax.set_title(f"Image {monet_jpgs.index(path) + 1}")

plt.tight_layout()
plt.show()
```



Prints out the shape of the a sample Photo JPG.

In [10]:
```
sample_photo_jpg = load_image(photo_jpgs[0])
print(f"JPG shape: {sample_photo_jpg.shape}")
```

```
JPG shape: (256, 256, 3)
```

Model Buliding & Architecture

This defines a helper that turns a list of file paths into a fully-pipeline'd tf.data.Dataset: it slices the paths, maps load_image across them in parallel, shuffles the examples, groups them into batches of size BATCH_SIZE, and prefetches with AUTOTUNE for performance. Finally, it instantiates two datasets —monet_ds and photo_ds—from your Monet and photo image path lists.

In [12]:
```
def make_dataset(paths):
    ds = tf.data.Dataset.from_tensor_slices(paths)
    ds = ds.map(load_image, num_parallel_calls=AUTOTUNE)
    ds = ds.shuffle(len(paths)).batch(BATCH_SIZE).prefetch(AUTOTUNE)
    return ds

monet_ds = make_dataset(monet_jpgs)
photo_ds = make_dataset(photo_jpgs)
```

This function implements a single ResNet “skip” block: it takes an input tensor x, applies two 3×3 convolutions (without bias) each followed by batch normalization and a ReLU (after the first convolution), then adds the original tensor (init) back to the result, enabling the network to learn residual mappings and improving gradient flow during training.

In [13]:
```
def resnet_block(x, filters):
    init = x
    x = layers.Conv2D(filters, 3, padding='same', use_bias=False)(x)
    x = layers.BatchNormalization()(x)
    x = layers.ReLU()(x)

    x = layers.Conv2D(filters, 3, padding='same', use_bias=False)(x)
    x = layers.BatchNormalization()(x)
    return layers.add([init, x])
```

This function builds the CycleGAN generator as a Keras Model that:

- Accepts a 256×256×3 input and applies a 7×7 convolution (64 filters) with batch normalization and ReLU.
- Downsamples twice via 3×3 convolutions (128 then 256 filters) with stride 2, each followed by BN+ReLU.
- Processes features through nine ResNet blocks (each performing two 3×3 convs + BN + ReLU and a skip connection) at 256 channels.
- Upsamples back to 256×256 with two 3×3 transpose convolutions (128 then 64 filters), again with BN+ReLU.
- Outputs a 256×256×3 image via a final 7×7 convolution with tanh, producing pixel values in [–1, 1].

In [14]:
```
def build_generator():
    inputs = layers.Input(shape=(IMG_SIZE, IMG_SIZE, 3))
    x = layers.Conv2D(64, 7, padding='same', use_bias=False)(inputs)
    x = layers.BatchNormalization()(x)
    x = layers.ReLU()(x)
```

```
    for f in [128, 256]:
        x = layers.Conv2D(f, 3, strides=2, padding='same', use_bias=False)(x
        x = layers.BatchNormalization()(x)
        x = layers.ReLU()(x)

    for _ in range(9):
        x = resnet_block(x, 256)

    for f in [128, 64]:
        x = layers.Conv2DTranspose(f, 3, strides=2, padding='same', use_bias
        x = layers.BatchNormalization()(x)
        x = layers.ReLU()(x)

    x = layers.Conv2D(3, 7, padding='same', activation='tanh')(x)
    return tf.keras.Model(inputs, x, name="Generator")
```

Call the build_generator() function to build a generator for Photo2Monet and Monet2Photo

In [15]:
```
G_photo2monet = build_generator()
G_monet2photo = build_generator()
```

This defines the CycleGAN discriminator as a Keras Model that takes a 256×256×3 image input and applies a series of 4×4 convolutions with increasing filters (64→128→256→512), downsampling via strides of 2 (except the last block), each followed by a LeakyReLU activation (α=0.2). A final 4×4 convolution projects to a single-channel output map, yielding a “PatchGAN” score for each patch to distinguish real from generated patches.

In [16]:
```
def build_discriminator():
    inp = layers.Input(shape=(IMG_SIZE, IMG_SIZE, 3))
    x = inp
    for f, stride in zip([64, 128, 256, 512], [2, 2, 2, 1]):
        x = layers.Conv2D(f, 4, strides=stride, padding='same')(x)
        x = layers.LeakyReLU(0.2)(x)
    x = layers.Conv2D(1, 4, padding='same')(x)
    return tf.keras.Model(inp, x, name="Discriminator")
```

Call the build_discriminator() function to build a discriminator for Monet and Photo images.

In [17]:
```
D_monet = build_discriminator()
D_photo = build_discriminator()
```

This code cell sets up the loss functions and optimizers in one go. Use MeanSquaredError for adversarial terms and MeanAbsoluteError for cycle-consistency and identity losses. The adversarial_loss pushes generated images’ predictions toward 1, while discriminator_loss averages the penalty for real (1) and fake (0) inputs. The cycle_loss measures absolute differences between originals and cycled images (scaled by LAMBDA_CYCLE), and identity_loss does the same for identity mappings (scaled by LAMBDA_ID). Finally, create Adam optimizers for both generator and discriminator using the learning rate (LR) and momentum term (BETA_1).

In [18]:
```
adv_loss_fn   = tf.keras.losses.MeanSquaredError()
cycle_loss_fn = tf.keras.losses.MeanAbsoluteError()

def adversarial_loss(real, pred):
    return adv_loss_fn(tf.ones_like(pred), pred)

def discriminator_loss(real, fake):
    real_loss = adv_loss_fn(tf.ones_like(real), real)
    fake_loss = adv_loss_fn(tf.zeros_like(fake), fake)
    return 0.5 * (real_loss + fake_loss)

def cycle_loss(real, cycled):
    return cycle_loss_fn(real, cycled) * LAMBDA_CYCLE

def identity_loss(real, same):
    return cycle_loss_fn(real, same) * LAMBDA_ID

gen_opt  = tf.keras.optimizers.Adam(LR,  BETA_1)
disc_opt = tf.keras.optimizers.Adam(LR,  BETA_1)
```

This snippet first creates two separate Adam optimizers—disc_monet_opt and disc_photo_opt—both using shared learning rate and momentum term. Then it defines a @tf.function-decorated train_step that, in one go, generates fake Monet and photo images, cycles them back, and computes the identity mappings; it evaluates all real and fake images with the respective discriminators, assembles the adversarial, cycle-consistency, and identity losses into a total generator loss, and computes discriminator losses. Finally, it takes gradients of those losses with respect to each network’s weights, applies the corresponding optimizer updates, and returns a dictionary of the generator and both discriminator losses for logging.

In [19]:
```
disc_monet_opt = tf.keras.optimizers.Adam(LR, beta_1=BETA_1)
disc_photo_opt = tf.keras.optimizers.Adam(LR, beta_1=BETA_1)

@tf.function
def train_step(real_monet, real_photo):
    with tf.GradientTape(persistent=True) as tape:
        fake_monet = G_photo2monet(real_photo, training=True)
        fake_photo = G_monet2photo(real_monet, training=True)

        cycled_photo = G_monet2photo(fake_monet, training=True)
        cycled_monet = G_photo2monet(fake_photo, training=True)

        same_photo = G_monet2photo(real_photo, training=True)
        same_monet = G_photo2monet(real_monet, training=True)
```

```
        disc_real_monet = D_monet(real_monet, training=True)
        disc_real_photo = D_photo(real_photo, training=True)
        disc_fake_monet = D_monet(fake_monet,  training=True)
        disc_fake_photo = D_photo(fake_photo,  training=True)

        gen_g_adv   = adversarial_loss(disc_fake_monet, disc_fake_monet)
        gen_f_adv   = adversarial_loss(disc_fake_photo, disc_fake_photo)
        total_cycle = cycle_loss(real_photo, cycled_photo) + cycle_loss(real
        id_loss     = identity_loss(real_photo, same_photo) + identity_loss(
        G_loss      = gen_g_adv + gen_f_adv + total_cycle + id_loss

        D_monet_loss = discriminator_loss(disc_real_monet, disc_fake_monet)
        D_photo_loss = discriminator_loss(disc_real_photo, disc_fake_photo)

    grads_G = tape.gradient(G_loss, G_photo2monet.trainable_variables + G_mo
    grads_D_m = tape.gradient(D_monet_loss, D_monet.trainable_variables)
    grads_D_p = tape.gradient(D_photo_loss, D_photo.trainable_variables)

    gen_opt.apply_gradients(zip(grads_G, G_photo2monet.trainable_variables +
    disc_monet_opt.apply_gradients(zip(grads_D_m, D_monet.trainable_variable
    disc_photo_opt.apply_gradients(zip(grads_D_p, D_photo.trainable_variable

    return {
        "G_loss": G_loss,
        "D_monet_loss": D_monet_loss,
        "D_photo_loss": D_photo_loss
    }
```

This loop first pulls one batch of real photos to use as a fixed “example” input. It then runs through EPOCHS iterations, and in each epoch it zips together the Monet and photo datasets, calling train_step on every pair to update the generators and discriminators. After each epoch it prints out the formatted generator and discriminator losses along with the elapsed time. On the first epoch and every SAMPLE_INTERVALth epoch thereafter, it feeds that fixed photo batch through the photo→Monet generator (inference mode), rescales the outputs back to 0–255, arranges them in a 1×BATCH_SIZE subplot row, titles the figure with the epoch number, and saves it to the OUTPUT_DIR before closing the plot.

In [20]:
```
example_photo = next(iter(photo_ds))

for epoch in range(1, EPOCHS+1):
    start = time.time()
    for real_monet, real_photo in tf.data.Dataset.zip((monet_ds, photo_ds)):
        losses = train_step(real_monet, real_photo)
    print(f"Epoch {epoch:03d}/{EPOCHS}  "
          f"G_loss: {losses['G_loss']:.4f}  "
          f"D_m: {losses['D_monet_loss']:.4f}  "
          f"D_p: {losses['D_photo_loss']:.4f}  "
          f"Time: {time.time()-start:.1f}s")

    if epoch % SAMPLE_INTERVAL == 0 or epoch == 1:
        fake = G_photo2monet(example_photo, training=False)
```

```
        fake = (fake + 1) * 127.5
        fake = tf.cast(fake, tf.uint8).numpy()
        fig, axes = plt.subplots(1, BATCH_SIZE, figsize=(16,4))
        for i, ax in enumerate(axes):
            ax.imshow(fake[i])
            ax.axis('off')
        plt.suptitle(f"Photo→Monet at Epoch {epoch}")
        plt.savefig(os.path.join(OUTPUT_DIR, f"sample_epoch_{epoch:03d}.png"
        plt.close()
```

```

```

This snippet creates a “submission_images” folder inside current output directory, then gathers and sorts all input photo paths. It loops over the first 10,000 images, loads and batches each one, runs it through the photo→Monet generator in inference mode, rescales the resulting tensor back to 0–255 uint8 pixel values, and saves each output as a zero-padded JPEG in the submission directory. Finally, it prints how many images were written.

In [21]:

```
SUB_DIR = os.path.join(OUTPUT_DIR, "submission_images")
os.makedirs(SUB_DIR, exist_ok=True)
photo_paths = sorted(glob.glob(f"{photo_jpg_dir}/*.jpg"))

for i, path in enumerate(photo_paths[:10000]):
    img = load_image(path)[tf.newaxis,...]
    monet_img = G_photo2monet(img, training=False)[0]
    monet_img = ((monet_img + 1) * 127.5).numpy().astype(np.uint8)
    Image.fromarray(monet_img).save(f"{SUB_DIR}/{i:05d}.jpg")
```

```
print(f"Saved {min(len(photo_paths),10000)} images to {SUB_DIR}")
```

```

Saved 7038 images to cyclegan_output/submission_images
```

This code defines the source directory for the generated images and a target ZIP file path, then opens a new ZIP in write mode with DEFLATED compression. It walks through every file under submission_images, adds each JPEG to the archive using a relative path (so the ZIP is flat), and finally prints the path to the completed ZIP.

In [22]:
```
src_folder = os.path.join(os.getcwd(), "cyclegan_output/submission_images")
zip_path = os.path.join(os.getcwd(), "generated/images.zip")

with zipfile.ZipFile(zip_path, "w", zipfile.ZIP_DEFLATED) as z:
    for root, _, files in os.walk(src_folder):
        for fname in files:
            full_path = os.path.join(root, fname)
            arcname = os.path.relpath(full_path, src_folder)
            z.write(full_path, arcname=arcname)

print("Done—created", zip_path)
```

```
Done—created /workspace/generated/images.zip
```

This code creates a 3×3 grid of 15×15-inch subplots at 100 DPI, then flattens the axes array so it can loop through the first nine Images to Monte images. For each subplot, it loads and rescales the image tensor from [–1, 1] back to [0, 1] for display, hides the axis ticks, and titles it with its image number. Finally, it applies a tight layout to remove extra padding and renders the figure.

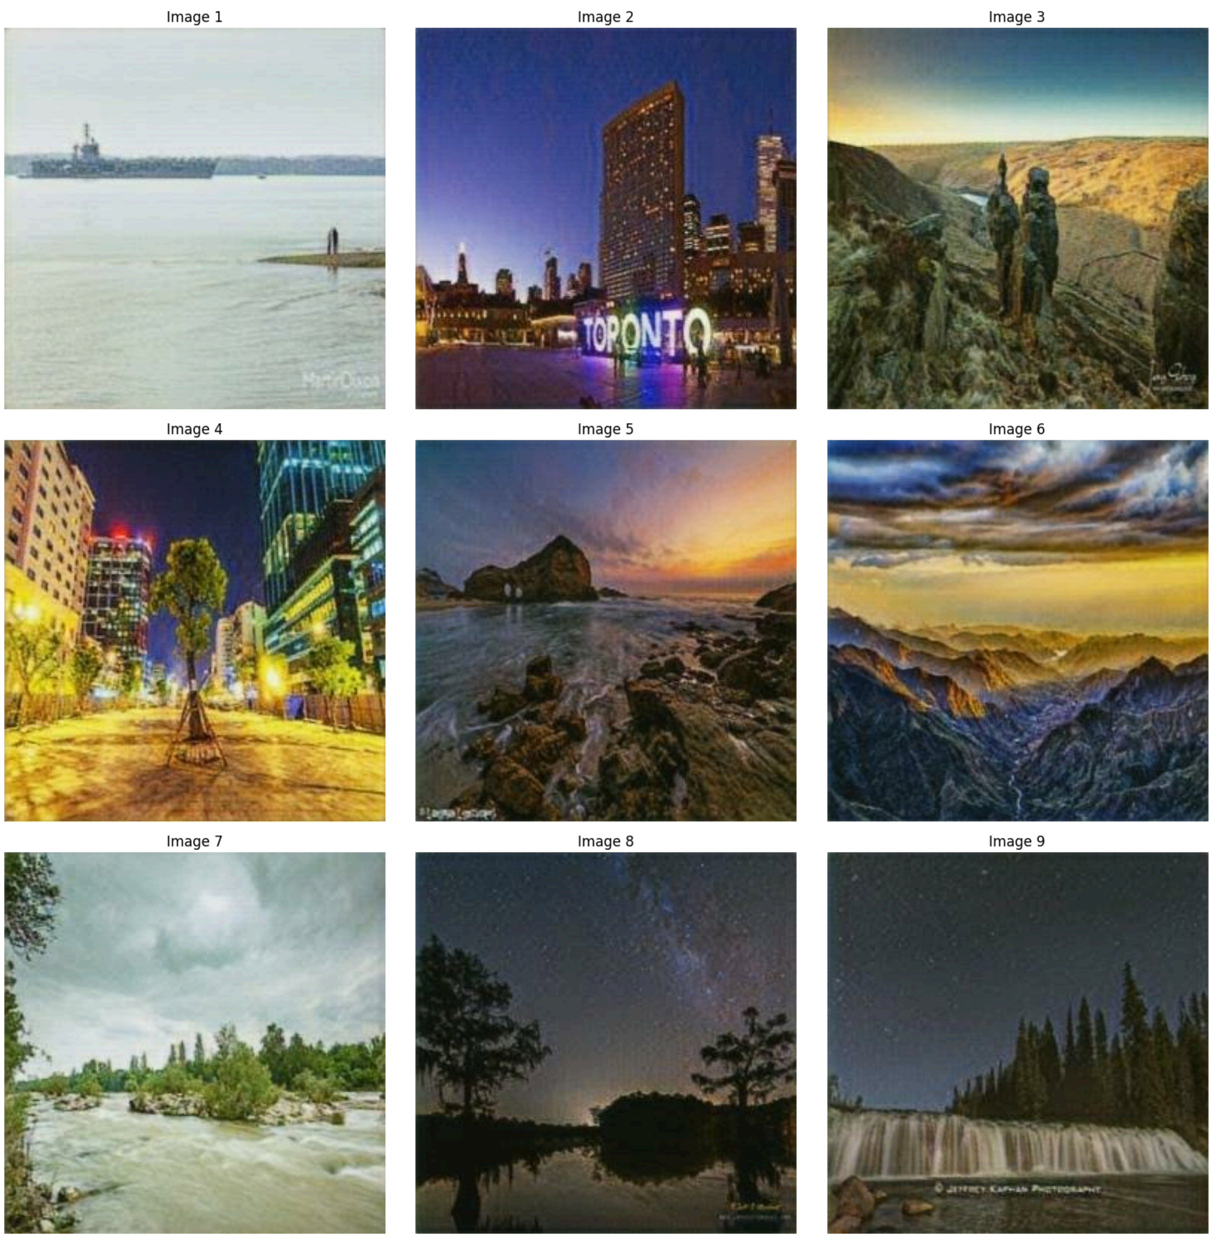
In [23]:
```
submission_jpgs = [os.path.join(src_folder, jpg) for jpg in os.listdir(src_f

fig, axes = plt.subplots(
```

```
    nrows=3, ncols=3,
    figsize=(15, 15),
    dpi=100
)

axes = axes.flatten()
for ax, path in zip(axes, submission_jpgs[:9]):
    img = load_image(path)
    ax.imshow(((img + 1.0) / 2.0).numpy())
    ax.axis("off")
    ax.set_title(f"Image {submission_jpgs.index(path) + 1}")

plt.tight_layout()
plt.show()
```



Conclusion

In this project, I built and trained a CycleGAN to translate between two image domains—photos and Monet-style paintings—by defining modular data pipelines, generator and discriminator architectures, and a combined adversarial plus cycle-consistency loss. I set up efficient input handling with tf.data and AUTOTUNE, applied residual blocks in your generator for stable feature learning, and used a PatchGAN discriminator to focus on local texture realism. During training, I monitored both adversarial and cycle losses, periodically visualized sample translations, and ultimately generated a set of stylized images for submission. This end-to-end workflow—from preprocessing and model design to inference and packaging—demonstrates how CycleGANs can learn complex style mappings without paired data, and provides a solid foundation for further experimentation with loss weights, network depth, or alternative normalization strategies to enhance output quality.
